1976-1977. The first year of the study was characterized by a severe drought, which caused a significant reduction in the amount of rainfall received. This, in turn, led to a decrease in the availability of water resources, particularly for irrigation purposes. The second year of the study was characterized by a more normal rainfall pattern, which allowed for a more stable supply of water resources. The third year of the study was characterized by a period of high rainfall, which led to a significant increase in the availability of water resources.
